

## Day 2 Activity File: Incident Analysis with Kibana

Today, you will use Kibana to analyze logs taken during the Red Team attack. As you analyze, you will use the data to develop ideas for new alerts that can improve your monitoring.

Important: Any time you use data in a dashboard to justify an answer, take a screenshot. You'll need these screenshots when you develop your presentation on Day 3 of this project.

⚠ Heads Up: To complete today's part of the project, you must complete steps 1-6 from the last class. Finding the flag isn't critical, but you want to get past the point of uploading the reverse shell script.

### Instructions

Even though you already know what you did to exploit the target, analyzing the logs is still valuable. It will teach you:

- What your attack looks like from a defender's perspective.
- How stealthy or detectable your tactics are.
- Which kinds of alarms and alerts SOC and IR professionals can set to spot attacks like yours while they occur, rather than after.

### Adding Kibana Log Data

To start viewing logs in Kibana, we will need to import our filebeat, metricbeat and packetbeat data.

Double-click the Google Chrome icon on the Windows host's desktop to launch Kibana. If it doesn't load as the default page, navigate to <http://192.168.1.105:5601>.

This will open 4 tabs automatically, but for now, we only want to use the first tab.

Click on the Explore My Own link to get started.

Adding Apache logs

Click on Add Log Data

### APM

APM automatically collects in-depth performance metrics and errors from inside your applications.

Add APM

### Logs

Ingest logs from popular data sources and easily visualize in preconfigured dashboards.

Add log data

### Metrics

Collect metrics from the operating system and services running on your servers.

Add metric data

Click on Apache logs

## Add Data to Kibana

All **Logs** Metrics SIEM Sample data

### ActiveMQ logs

Collect ActiveMQ logs with Filebeat.

### Apache logs

Collect and parse access and error logs created by the Apache HTTP server.

### AWS Cloudwatch logs

Collect Cloudwatch logs with Functionbeat.

Scroll to the bottom of the page. Click on Check Data You should see a message highlighted in green: Data successfully received from this module

### Module status

Check that data is received from the Filebeat `apache` module

Check data

Data successfully received from this module

Close Google Chrome and all of it's tabs. Double click on Chrome to re-open it.

## Dashboard Creation

Create a Kibana dashboard using the pre-built visualizations. On the left navigation panel, click on Dashboards.

Click on Create dashboard in the upper right hand side.

On the new page click on Add an existing to add the following existing reports:

- HTTP status codes for the top queries [Packetbeat] ECS
- Top 10 HTTP requests [Packetbeat] ECS
- Network Traffic Between Hosts [Packetbeat Flows] ECS
- Top Hosts Creating Traffic [Packetbeat Flows] ECS
- Connections over time [Packetbeat Flows] ECS
- HTTP error codes [Packetbeat] ECS
- Errors vs successful transactions [Packetbeat] ECS
- HTTP Transactions [Packetbeat] ECS

Example for adding the first report:

# Add panels

HTTP status

Sort

Types

4

Http Status over time [Filebeat AWS]

HTTP Status Codes [Metricbeat CouchDB] ECS

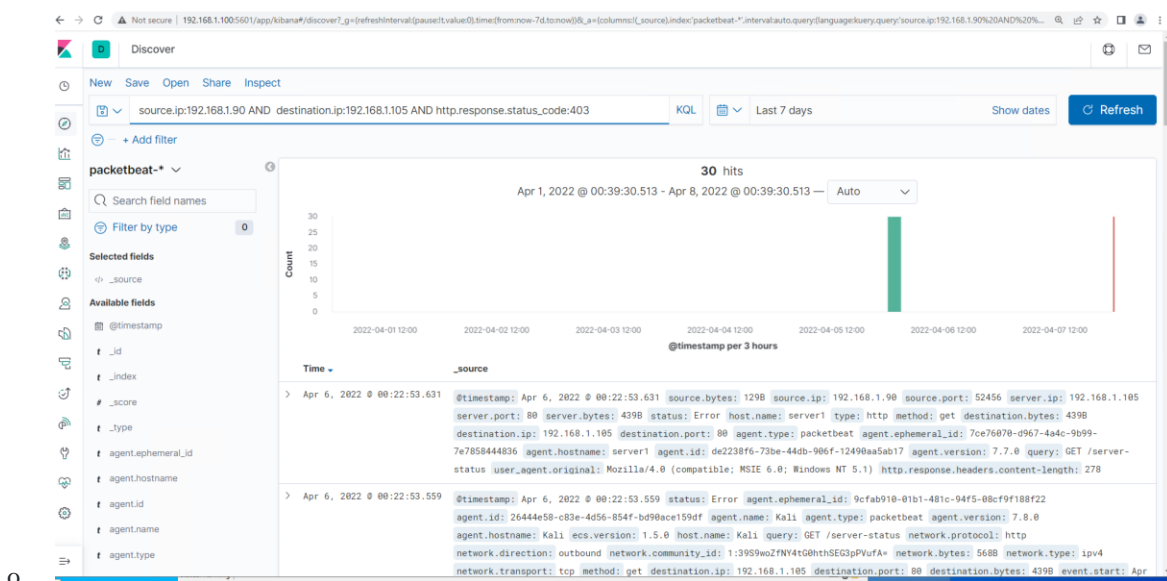

HTTP status codes for the top queries [Packetbeat] ECS

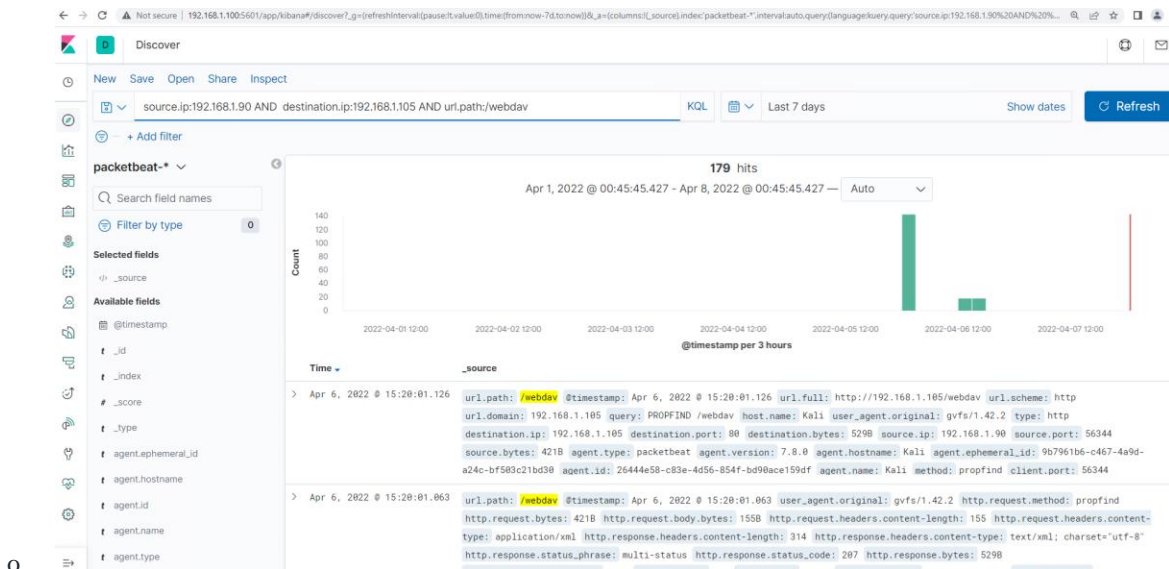

The remaining steps will be a process of self-discovery to be completed without screen shot examples.

Get familiar with running search queries in the Discover screen with Packetbeat. This will be located on your fourth tab in Chrome.

- On the Discover page, locate the search field.
- Start typing source and notice the suggestions that come up.
- Search for the source.ip of your attacking machine.
- Use AND and NOT to further filter you search and look for communications between your attacking machine and the victim machine.
- Other things to look for:
  - o url o status\_code o error\_code

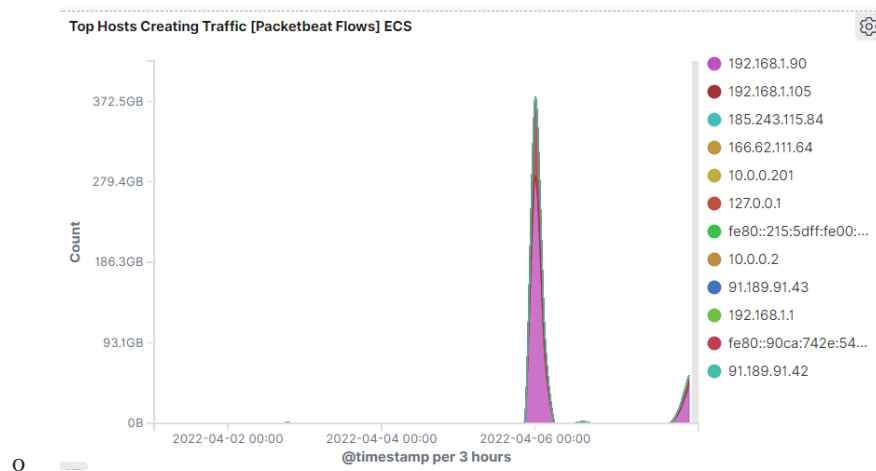

After creating your dashboard and becoming familiar with the search syntax, use these tools to answer the questions below: 1. Identify the offensive traffic.

- o Identify the traffic between your machine and the web machine:
  - ☐ When did the interaction occur?
    - Between 21:00 4/5/22 and 3:00 4/6/22
  - ☐ What responses did the victim send back?
    - 200, 204, 403, 301, 401
  - ☐ What data is concerning from the Blue Team perspective?
    - The access granted on 200, the forbidden 403 and 401, the sheer visual spike that we see in traffic, especially coming from one source

2. Find the request for the hidden directory.

- o In your attack, you found a secret folder. Let's look at that interaction between these two machines.

- How many requests were made to this directory? At what time and from which IP address(es)?

url.full: Descending	Count
http://192.168.1.105/company_folders/secret_folder	14,164
http://127.0.0.1/server-status?auto=	2,670
http://snnmnkxdhflwgthqismb.com/post.php	379
http://www.gstatic.com/generate_204	196
http://192.168.1.105/webdav	179

Export: [Raw](#) [Formatted](#)

- Which files were requested? What information did they contain?

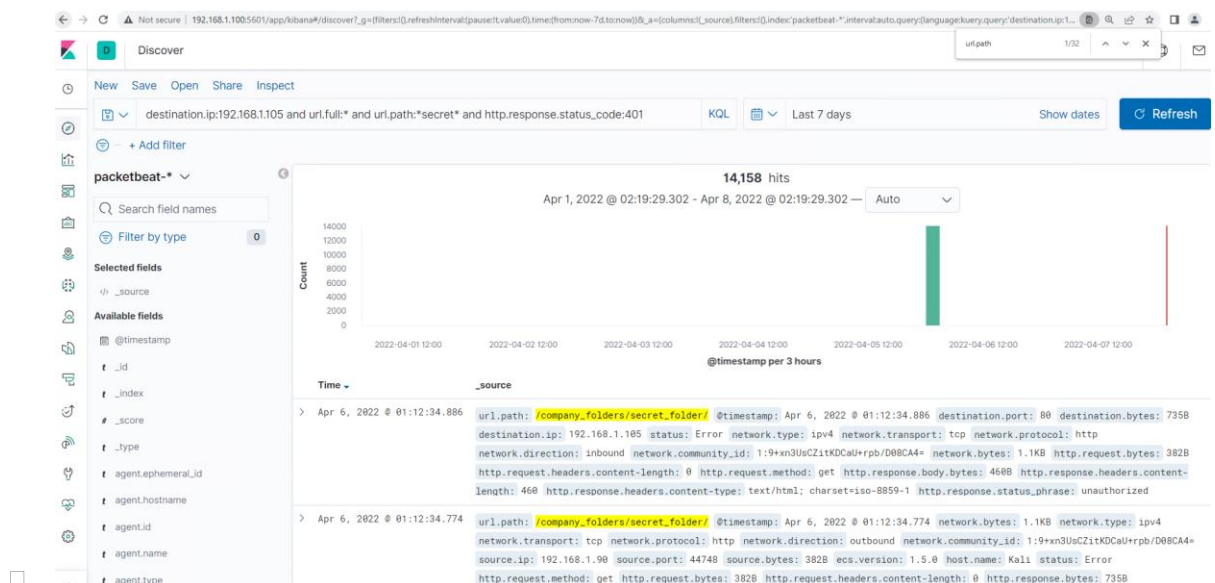

http.response.headers.content-type: text/html; charset=iso-8859-1

- 
- What kind of alarm would you set to detect this behavior in the future?
- Identify at least one way to harden the vulnerable machine that would mitigate this attack. – complicated password, obscuring filename with attention, alert when accessed outside of regular

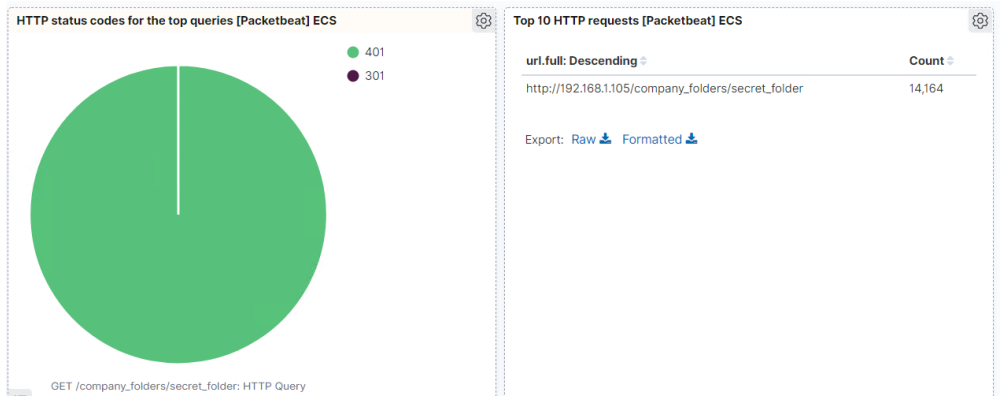

### 3. Identify the brute force attack.

- After identifying the hidden directory, you used Hydra to brute-force the target server. Answer the following questions:

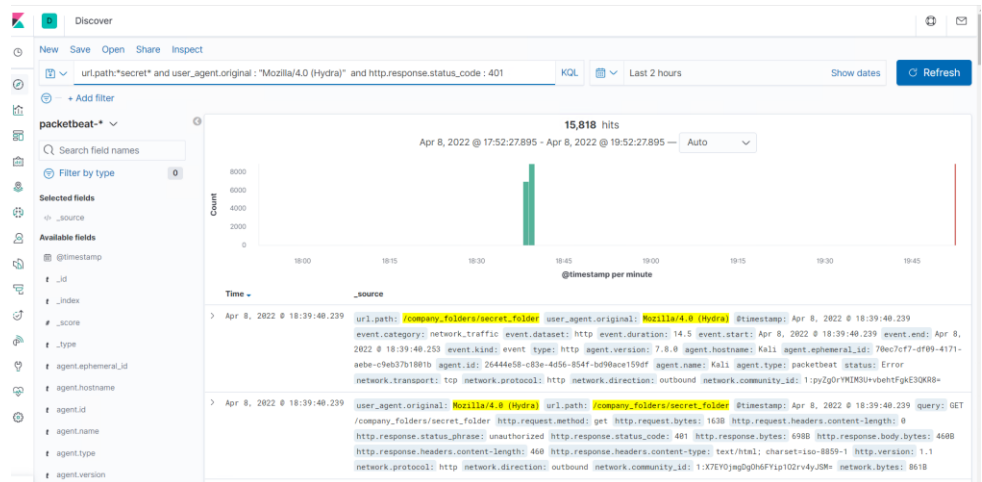

- Can you identify packets specifically from Hydra?

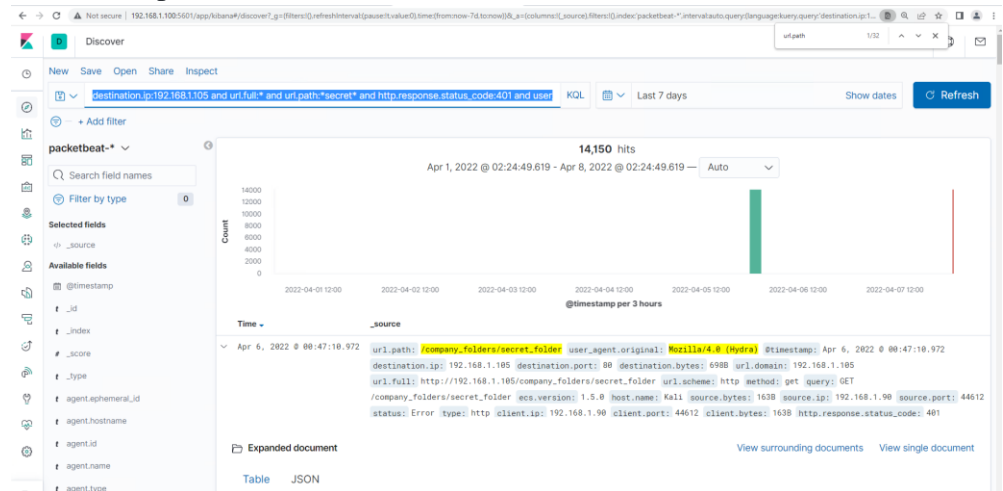

- How many requests were made in the brute-force attack?
  - 14158 on first attempt

- 15819 on second attempt
- Second Attempt

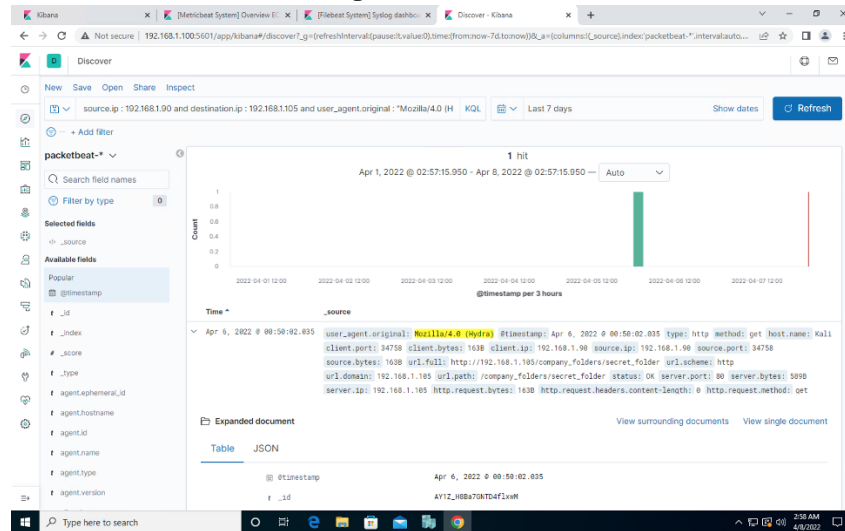

- First Attempt

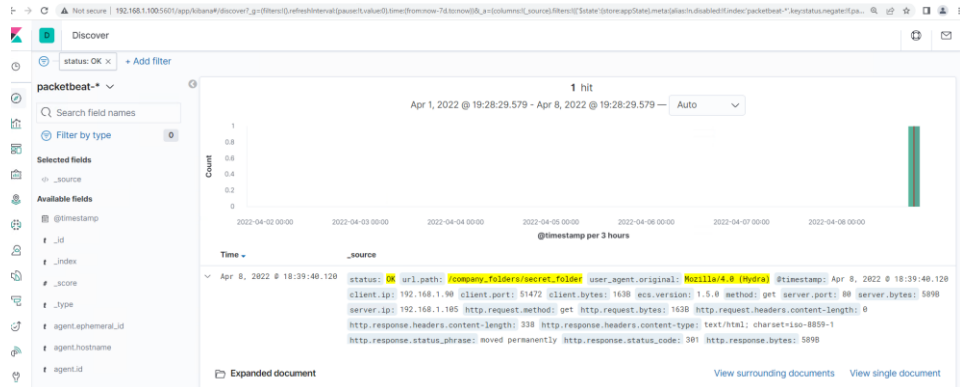

- How many requests had the attacker made before discovering the correct password in this one?

- 15818 on the second attempt

- 14150

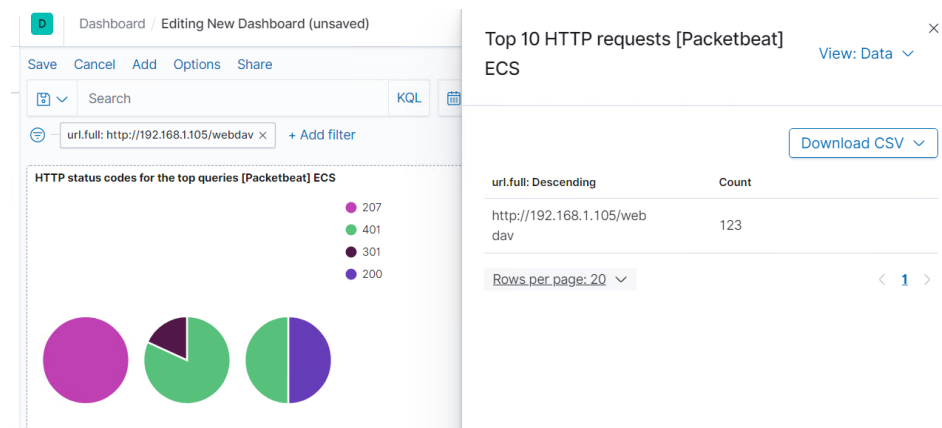

- ☐ What kind of alarm would you set to detect this behavior in the future and at what threshold(s)?
- ☐ Identify at least one way to harden the vulnerable machine that would mitigate this attack.

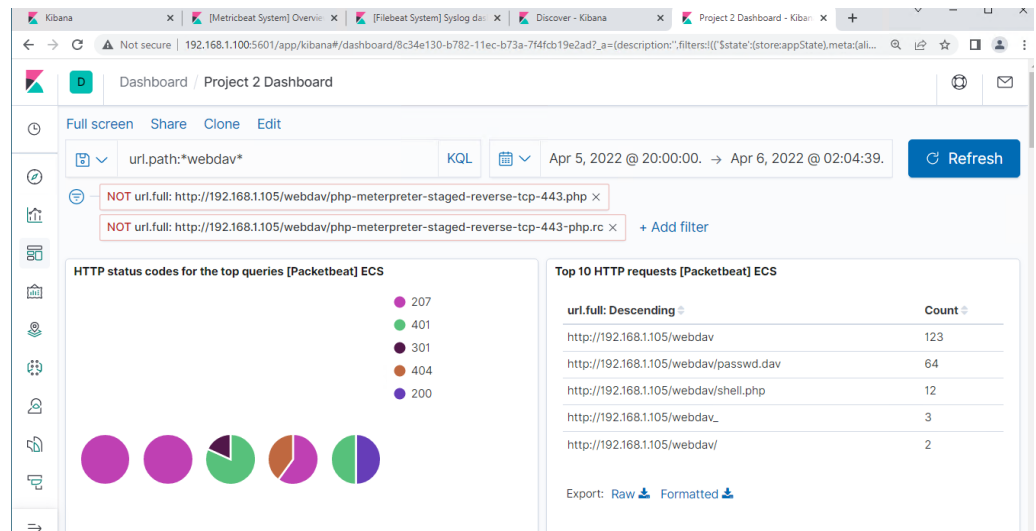

#### 4. Find the WebDav connection.

- o Use your dashboard to answer the following questions:
  - ☐ How many requests were made to this directory?

- 123

- Which file(s) were requested?

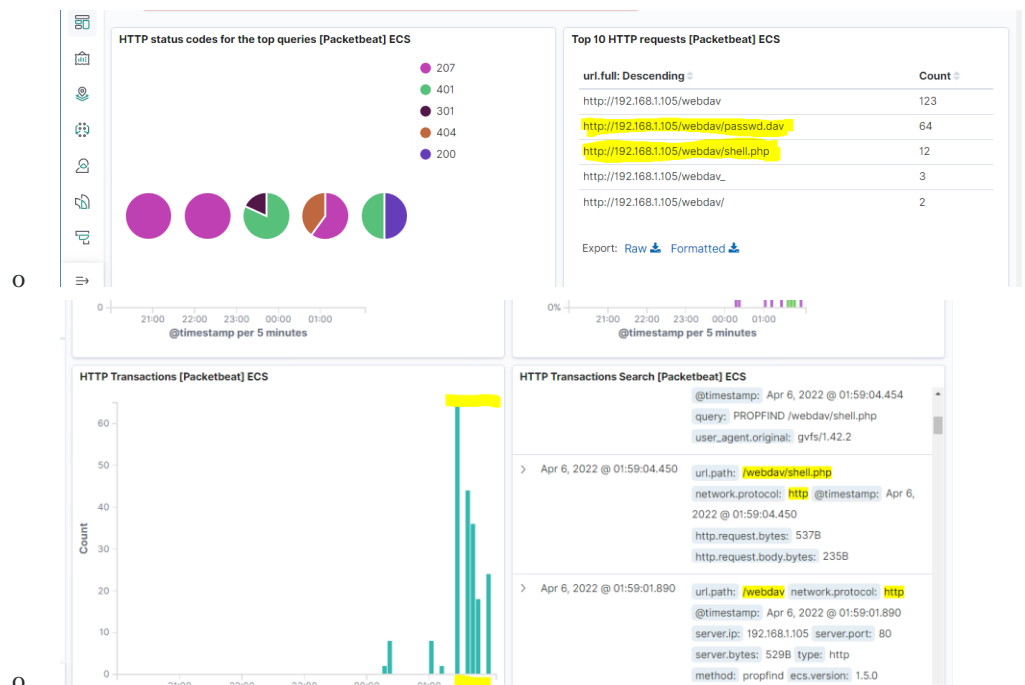

- What kind of alarm would you set to detect such access in the future?
- Identify at least one way to harden the vulnerable machine that would mitigate this attack.

## 5. Identify the reverse shell and meterpreter traffic.

- To finish off the attack, you uploaded a PHP reverse shell and started a meterpreter shell session. Answer the following questions:

- Can you identify traffic from the meterpreter session?
  - Started by examining the php file access

- What kinds of alarms would you set to detect this behavior in the future?
- Identify at least one way to harden the vulnerable machine that would mitigate this attack.
